

TAXONOMY OF BUSINESS METRICS

ABSTRACT OF THE INVENTION

5 A method and system for organizing data to facilitate access to
information defined by an analytic application. In particular, a taxonomy
(hierarchy) for organizing the information and data (e.g., business metrics,
transformed data, untransformed data, or raw data) is described. The
information and data are stored in a repository and categorized in a hierarchical
organization navigable by users. A user can select certain instances of the data
10 in the hierarchy to create a customized list containing data of particular interest.
Accordingly, access to particular information in the vast amount of information
defined by an analytic application is facilitated, and new information of
particular interest can be accessed in a timely manner.
